

Part Processing

Slotted For Automation

Put the part in the machine. Take the part out of the machine. Put the part in... Who needs the monotony day after day? Not workers at a major off-road implement manufacturing plant. Today an entire part slotting operation hums along without any operator attention - that is, except when people put their brains to work for monitoring, maintenance and troubleshooting. The process even counts ejected slugs to make sure all slots have been cut.

What could your company gain from automation like that?

Call us. We'll show you how our "keep it simple" approach to robotics and automation can benefit you.
